

Cruise Report SU-93-03
NOAA Ship *Surveyor*

Itinerary and Area – Dutch Harbor to Dutch Harbor (1–23 September 1993). North of the Aleutian Islands to recover the PROTEUS mooring and calibrate sensors; stop at Umnak Island (Nikolski) to offload two scientists; CTD casts along the south side of the Aleutian Islands westward to Amchitka Pass; casts along the north side of the Islands and across Amukta Pass; CTD casts (and deployment of four current moorings) along the continental slope and shelf of the eastern Bering Sea to 60°N; search for lower part of mooring 2; and return to Dutch Harbor.

Participating Organizations – NOAA, Pacific Marine Environmental Laboratory (PMEL) and NOAA, Alaska Fisheries Science Center (AFSC).

Scientific Personnel – Ron Reed, Carol DeWitt, Leslie Lawrence, LTJG Carrie Hadden, Rick Miller, and Bill Parker.

Objectives – The goals of this project were to gain understanding of circulation along the south and north sides of the Aleutian Islands and through the island passes, and to examine circulation and slope-shelf exchange along the eastern boundary of the deep basin. This work was all part of Bering Sea – FOCI (Fisheries Oceanography Coordinated Investigations).

Summary – The PROTEUS mooring, and a subsurface ADCP mooring, were recovered on 2 September. A total of 182 CTD casts were taken. Four subsurface current moorings were deployed, each at a depth of ~200m. One satellite-tracked drifter was released in the Alaskan Stream. Details on all the observations are given in the attached table.

PROTEUS Mooring – Both a subsurface ADCP mooring and the surface PROTEUS mooring were recovered on 2 September. A CTD calibration cast was taken prior to recovery of the surface mooring. Eleven chlorophyll (and nutrient) samples were taken, processed, and frozen. Three Tucker trawls were planned at the site; only one was successfully taken, mainly because of problems with the electronic counter (wire out). The large sample was split and preserved in formalin.

Current Moorings – Four subsurface current moorings were deployed anchor first, using a gravity release when the weight touched bottom. Each mooring had an upper (50m depth) acoustic current meter and a lower (190m depth) rotor/vane current meter. Moorings 1, 2, and 3 were all placed at 200m, and mooring 4 was deployed on a steep slope at 205m. The only major difficulty was in deploying mooring 2. Winds increased rapidly to ~30 kt; their effect on the ship produced a large wire angle, and it was difficult to get the gravity hook to release.

On 15 September, two days after deployment of mooring 2, we were notified by PMEL that the upper meter on the mooring had been pulled up by a trawler. Consequently, we were requested to search for it, on the return to Dutch Harbor, and attempt to redeploy it. On 22 September, we located mooring 1 and determined that its range was 2.5nm. We then searched for mooring 2, using a spacing of 2.0nm, first around the deployment site and then along the trawl line, as reported by the trawler. The search was futile. After our return to Seattle (24 September), PMEL received a message that the bottom meter had been found by another trawler. Hence none of mooring 2 is near the original site, and only the anchor and acoustic release remain in the water.

CTD Casts – The CTD casts obtained provide an excellent synoptic data set that shows variations in water properties and details of the circulation system. Agreement between CTD salinity, temperature, and pressure and salinometer salinities, reversing thermometer temperatures, and thermometric depths was excellent. This does not mean we had no problems with the instruments, however. On station 35, salinity oscillations were noted and found to be caused by a faulty thermister. The thermistor was changed and the cast repeated. Later, intermittent spiking (in one, two, or all sensors) became a problem. The CTD

connections were cleaned and the cable reterminated. Eventually, however, spiking became much worse, and the conductivity and pressure sensors were replaced. This essentially solved the problem. (The spikes, though bothersome, can be easily removed from the data.) We had problems with Niskin bottles, used to collect nutrient samples, tripping on a few stations. This was corrected by change to a new rosette.

Acknowledgments - I appreciate the excellent cooperation and the efforts of CAPT Jones, LT Lowell, and the officers and crew of the *Surveyor*. ET May was quite helpful in assisting with CTD problems. The careful monitoring of CTD data by the scientific staff (Carol DeWitt, Leslie Lawrence, and Carrie Hadden), and their efforts to fix problems and provide data output, are greatly appreciated.

R.K. Reed
Chief Scientist
